DETAILED ACTION

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

3. Claims 1-3 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kachnic (5928578) in view of Williamson (5514309).

Kachnic teaches an injection molding machine 10 with the mold halves 14, 16, sensor 20 (electronic camera), controller 70 that operates via electrical interface 72 to the machine 10, the images are compared by a computer or microprocessor (Col. 6, lines 21-24), the analyzing means compares it with memory 73, and sends signals of when to open and close the mold via processor 72.

Kachnic fails to teach an infrared sensor/thermograph.

Williamson teaches the use of a heat sensor 33, an infrared heat sensor, that detects the changes in temperature. Williamson also teaches sensors 52 that are connected to the program controller 55. It would have been obvious for one of ordinary skill in the art to modify Kachnic with infrared sensors as taught by Williamson because it allows for detection of the cooling of the part. The image of the procured from the heat sensor would be compared and analyzed similar to the images detected by the electronic camera of Kachnic for finding the comparison and sending a signal accordingly from the processor to the molding machine.
